

Portunus pelagicus
Blue Swimming Crab

Scientific classification

Kingdom: [Animalia](#)
Phylum: [Arthropoda](#)
Subphylum: [Crustacea](#)
Class: [Malacostraca](#)
Order: [Decapoda](#)
Infraorder: [Brachyura](#)
Family: [Portunidae](#)
Genus: [Portunus](#)
Species: [P. armatus](#)

Binomial name

Portunus armatus
(Linnaeus, 1758)

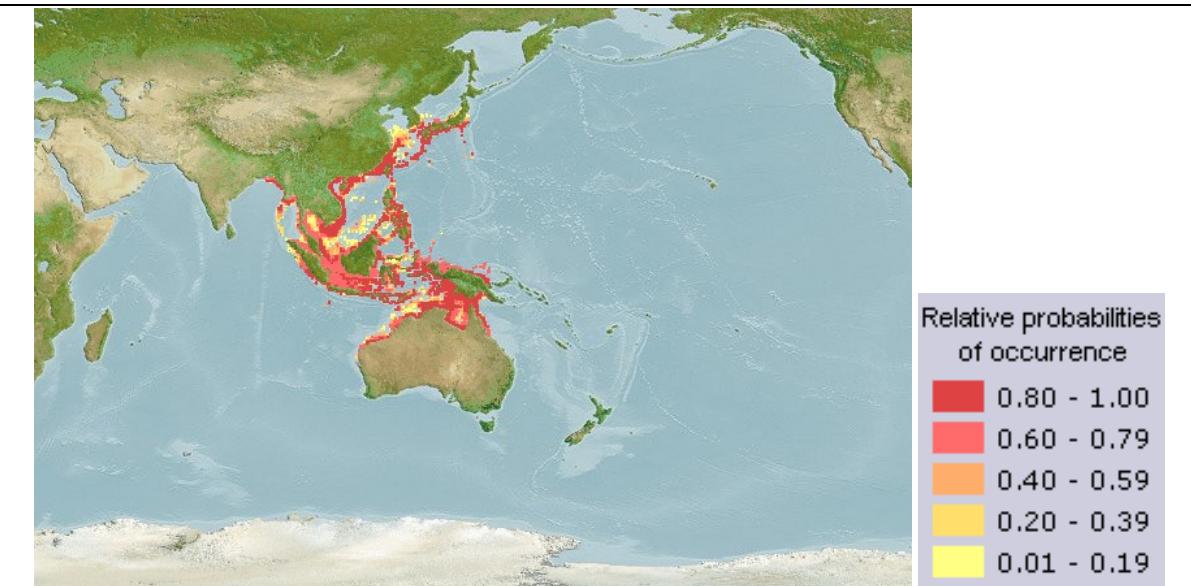

Synonyms

Cancer pelagicus Linnaeus,
1758

A. Environment/Ecology:

Reef-associated; brackish; depth range 0 - 65 m (Ref. [111223](#)). Tropical, preferred 26°C (Ref. [107945](#)); 35°N - 15°S, 99°E - 137°E

B. Distribution:

A tropical species, blue swimmer crabs are found in estuaries and inshore marine waters, mainly between Nickol Bay and Dunsborough. They are also found off northern and eastern Australia and are widely distributed in the Indian and Pacific oceans, including the east coast of Africa and southern Japan. They have even been found in the Mediterranean Sea, having entered via the Suez Canal.

C. Length at first maturity / Size / Weight / Age:

Maturity: L_m [7.3](#), range 3 - ? cm

Max length : 20.0 cm CW male/unsexed; (Ref. [343](#))

Blue swimmer crabs are sometimes called 'blue manna'. In WA, they can grow to have a carapace up to 25 centimetres wide and a claw span up to 80 centimetres. The biggest blue swimmer crab caught in WA weighed more than a kilogram. These crabs belong to the Portunidae family, which also includes other large, edible crabs found in Australia such as mud crabs. Crabs from this family can usually be recognised by their flat, discshaped hind legs, used as paddles for swimming and by the nine spikes, called horns, along their carapace, either side of their eyes.

Size limit A Blue Swimmer Crab is undersized if the carapace is less than 11 cm when measured from side to side at the base of the largest spines. Size limits apply in all waters of the state

Length at First Maturity= carapace size of 10.5 cm for females and 9.6 cm for males Size= maximum size of 14 to 15 cm Weight= ?? Age= ??(FiA,2020).

D. Short description

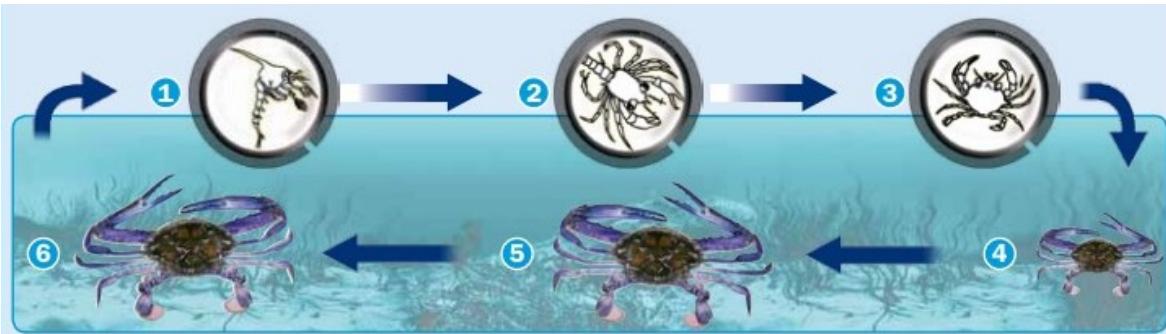

Carapace rough to granulose, regions discernible; front with 4 acutely triangular teeth; 9 teeth on each anterolateral margin, the last tooth 2 to 4 times larger than preceding teeth. Chelae elongate in males; larger chela with conical tooth at base of fingers; pollex ridged. Color: males with blue markings, females dull green.

E. Biology

Matures at about 1 year. Collected mainly by artisanal traps, trawls, beach seines, cylindrical wire traps, folding traps, pots, hop nets, drop nets, and sunken crab gill nets. In shallow waters, it is caught using beach seines, rakes, and dab nets. Sold in local markets (fresh or frozen) and for the crab-flesh canning industry. Most widely sold in markets of Southeast Asia, including the Philippines (Ref. 343). Maximum depth from Ref. 801. Immediate subtidal to a depth of 40 m (Ref. 801), on sandy to sandy-muddy substrates in areas near reefs, mangroves, and sea grass and algal beds (Ref. 343). Juveniles tend to occur in shallow intertidal areas (Ref. 343). Burrows in sand when disturbed; carnivorous and voracious predator (Ref. 801). Host to protozoans, helminths and crustaceans (Ref. 104981). Members of the order Decapoda are mostly gonochoric. Mating behavior: Precopulatory courtship ritual is common (through olfactory and tactile cues); usually indirect sperm transfer (Ref. 833). Spawning occurs throughout the year, with peaks in December, March and August (Ref. 119312).

F. Life cycle and mating behavior

The timing and movements of blue swimmer crabs vary between locations. Estuarine crabs, such as those living in the Leschenault Inlet, Peel-Harvey Estuary and Swan River, tend to move from estuaries into nearby marine waters during winter. Crabs in marine embayments such as Cockburn Sound and Shark Bay spend their entire lives within different parts of the embayment.

Juvenile crabs

By autumn, most megalopae have formed into juvenile crabs with a recognisable crab shape and carapace three to six centimetres wide. They continue growing rapidly.

Mating

Most blue swimmer crabs mate in autumn. The males moult first, so that their shells have hardened beforehand. A courting male then catches a female and carries her beneath him for four to 10 days while fending off other males. The male helps the female to moult and then turns her over to mate while she is still soft-shelled. After mating, he continues to carry her around and protect her for another three-to-four days while her shell hardens. A male may mate with several females during one season. The female crabs retain the males' sperm over winter until their ovaries develop – helped, it is thought, by the rising water temperature in spring.

G. Fisheries

Mainly collected by artisanal traps, trawls, beach seines, cylindrical wire traps, folding traps, pots, hop nets, drop nets and crab gill nets. The total catch reported for this species to FAO for 1999 was 133 938 t. The countries with the largest catches were China (52 577 t) and Philippines (34 076 t). For sale in local markets (frozen or fresh) and for the crab-flesh canning industry. It attains lower prices than Scylla although crabs of *Portunus* are taken in larger quantities.

9) Eggs

Egg Characteristics of *Portunus Pelagicus*

The eggs are fertilised by the stored sperm and, when laid, they attach to hairs in a spongy mass under the female's abdomen. The eggs go from orange to black as they mature. The term for a female crab carrying egg clusters in this way is 'berried'. Any berried females caught by fishers must be returned to the water. The female incubates the eggs for about 18 days. When the embryos inside are mature she shakes the eggs off her abdomen and they hatch into zoea

19) Recruitment

A term used by researchers to describe the addition of crabs or fish (juvenile or of legal size) to a population, either by reproduction or migration. Levels of recruitment of adult crabs to WA's blue swimmer crab populations fluctuate considerably. A range of environmental factors – including water temperature variations, the relative strength of wind and current systems, and the amount and timing of rainfall – can affect the survival and growth rates of crab larvae and juveniles. This in turn leads to big fluctuations in the available crab harvest from time to time. Estuaries along WA's west coast, including the PeelHarvey near Mandurah, are under pressure from rapid population growth. This includes increases in recreational and commercial fishing activity, urban development and associated environmental change, which may also affect crab recruitment.

20) Abundance
